

Challenge 1 - Before Interview

1. Considering Python 3.6 or newer, create a Github repository to solve with Python the following challenge: given that you cannot use any mathematical operation different from SUM, create a program that solves the Exponentiation for entries x and y . Consider that you are working with a very simple programming language and you cannot use any python library or function. The user will be prompted to enter non-negative values for x and y and the script will return x^y .
